

AMENDMENTS TO THE CLAIMS

This listing of claims will replace all prior versions, and listings, of claims in the application:

1. (Currently Amended) A data driven processing method, comprising:

providing, by an external host controller, a first set of instructions ~~and incoming data to a~~ first processing unit, of a data driven processor having a plurality of processing units, the first processing unit to operate upon ~~said incoming data in accordance with the first set of~~ instructions;

configuring, by the external host controller, a data path through a mesh arrangement of data ports for transferring data between a second processing unit of the data driven processor and external memory, wherein the data path couples the second processing unit to the external memory through a memory access unit of the data driven processor, wherein the coupling of each pair of data ports of adjacent processing units is a point-to-point connection, and wherein the mesh arrangement of data ports allows data flow (a) from any one of the processing units directly to another without accessing memory and (b) from any one of the processing units to the memory access unit; and

the first processing unit, in response to recognizing that the first set of instructions will require one of reading from and writing to external memory based on having processed the first set of instructions, provides addressing information to ~~a the~~ memory access unit of the processor through a control port of the first processing unit to enable the transfer of additional data between the external memory and the second processing unit via said data path.

2. (Original) The method of claim 1 wherein the first processing unit recognizes an image processing motion vector in said first set of instructions, and said additional data is to be written to the external memory and includes a macro block generated by the second processing unit based on the motion vector.

3. (Currently Amended) The method of claim 1 wherein ~~the data path is configured by an external host controller~~ first and second processing units each have a plurality of control ports including an input control port and an output control port, and wherein the input control port of a

processing unit is programmable to route incoming command information to anyone of the output control ports of the processing unit.

4. (Original) The method of claim 1 further comprising:

the first processing unit providing an indication to the memory access unit of whether the transfer is one of a read and a write.

5. (Currently Amended) A data processor comprising:

a first direct memory access (DMA) unit; and

a plurality of processing units each having a plurality of data ports, the data ports of adjacent processing units being coupled to each other in a mesh arrangement by point-to-point connections and programmable to allow data flow (a) from any one of the processing units directly to another without accessing memory and (b) from any one of the processing units to the DMA unit, ~~the plurality of processing units are essentially identical units each having a plurality of sides, each side having a plurality of unidirectional data ports being an input port and an output port wherein the input port is programmable to route incoming data to any one of the output ports,~~

wherein one of the processing units has a control port from which it is to send information to the DMA unit about setting up a DMA channel through which one of data to be consumed and result data by one of the processing units is transferred; and

a host interface unit to receive instructions, from an external host controller, that configure the data flow between the data ports of adjacent processing units and between the data ports and the DMA unit to create a data path from one of the processing units to external memory.

6. (Original) The processor of claim 5 further comprising:

memory interface circuitry, wherein the DMA unit is to access external memory via the memory interface circuitry.

7. (Currently Amended) The processor of claim 6 ~~further comprising a host interface through which a host processor is to configure data flow between the data ports,~~ wherein the memory interface circuitry is on-chip with the DMA unit, the plurality of processing units, and the host interface.

8. (Original) The processor of claim 6 wherein the memory interface circuitry is designed to interface with external memory that is dynamic random access memory.

9. (Previously Presented) The processor of claim 5 wherein each of the processing units has an input programming element (PE) to read incoming data from any one of its input ports, an output PE to write result data to any one of its output ports, and a core PE to execute instructions independently of a data path that is operating through a pair of the input and output ports of that processing unit.

10. (Previously Canceled)

11. (Previously Presented) The processor of claim 6 wherein each of the plurality of processing units has a plurality of control ports on each side including an input control port and an output control port, and wherein the input control port of a processing unit is programmable to route incoming command information to any one of the output control ports of said processing unit.

12. (Original) The processor of claim 9 further comprising an interface to an external device, and wherein the output ports of one of said processing units are coupled to the input ports of an adjacent one of said processing units except that some of the output ports of an outlying one of said processing units are coupled to the external device interface.

13. (Previously Presented) The processor of claim 5 further comprising:
a second DMA unit, wherein there are at least four of said plurality of processing units, the data ports on a north side of first and second ones of said four processing units are coupled to the first DMA unit, the data ports on a south side of third and fourth ones of said four processing units are coupled to the second DMA unit, and the data ports of the south side of the first and second processing units are coupled to the data ports of a north side of the third and fourth processing units.

14. (Original) The processor of claim 13 further comprising an interface to an external device, wherein some of the data ports of east and west sides of the processing units are coupled to the external device interface.

15. (Currently Amended) The processor of claim 5 further comprising a central processing unit to read and execute instructions that configure the data flow between the data ports of adjacent processing units and between the data ports and the DMA unit to create a data channel from one of the processing units to external memory.
16. (Currently Amended) The processor of claim 5 ~~further comprising a host interface unit to receive instructions from an external host controller, that configure the data ports and the DMA unit to create a data channel from one of the processing units to external memory wherein the plurality of processing units are essentially identical units each having a plurality of sides, each side having a plurality of unidirectional data ports being an input port and an output port wherein the input port is programmable to route incoming data to any one of the output ports.~~
17. (Currently Amended) A system comprising:
 ~~a~~ an external host controller;
 external memory;
 a data driven processor having a memory access unit to interface the external memory, a plurality of processing units each having a plurality of data ports, the data ports of adjacent processing units being coupled to each other in a mesh arrangement by point-to-point connections and programmable to allow data flow (a) from any one of the processing units directly to another without accessing memory and (b) from any one of the processing units to the memory access unit, and a host interface unit to receive instructions from the external host controller that configure the data flow between the data ports of adjacent processing units and between the data ports and the memory access unit to create a data path from one of the processing units through ~~a data channel~~ the mesh arrangement of data ports to the external memory, wherein one of the processing units has a control port which it uses to write data location information to the memory access unit; and
 one of a rechargeable battery and a fuel cell coupled to power the external memory, the external host controller, and the data driven processor.
18. (Currently Amended) The system of claim 17 wherein the external host controller includes an embedded processor and its associated main memory.
19. (Canceled)

20. (Currently Amended) The system of claim ~~49~~17 wherein each of the processing units has a core programming element (PE) that can be programmed to execute instructions that operate on incoming data received via an input data port of that processing unit, an input PE that can read data from any one of a plurality of input data ports of that processing unit, and an output PE that can write data to any one of a plurality of output data ports of that processing unit.

21. (Original) The system of claim 20 wherein the core PE of each processing unit can execute its instructions independently of a data path that is operating through a pair of said input and output data ports of that processing unit.

22. (Original) The system of claim 17 wherein the data location information that is sent through the control port includes information about the size and display location of a block of image data.

23-29. (Canceled)
